

Omega Logic on your phone

Three apps: the plant, the office, the customer. Install them, run the work, one system. ClearSky-OMEGA

1. Three apps, one system

Omega Logic is the order-to-serial system your business runs on: an order comes in, is priced and accepted, becomes a work order, is built at benches, tested, shipped and followed by the customer. The desktop office pages are the full system. The three phone apps put the daily decisions where the person is. Nothing lives only on a phone: every app reads and writes the same order, work order and unit records through the same signed-in endpoints as the desktop, so what one person does on a phone is on every other screen the moment it is saved.

APP	WHO	WHAT IT IS FOR	ADDRESS
Plant	the two builders	work orders, every unit and its step, the bench scanner, stock, quality holds	silmarillion.clearskyomega.com/plant/app?org=cleancell.us
Office	project manager, procurement, commissioning	what needs a person today, orders and customer requests, PO loads, customers and terms, assigning finished stock	silmarillion.clearskyomega.com/office/app?org=cleancell.us
Customer	the buyer	site plans in Editor Lite, orders with their milestone and warranty, purchase orders, the account	silmarillion.clearskyomega.com/portals/customer/app?org=cleancell.us
Bench	a tablet at a bench, or a builder's phone	scan a unit in, issue its parts, finish the step, send it on	silmarillion.clearskyomega.com/plant/station.html (opened from the Plant app's Scan tab)

What stays on the desktop, on purpose. Approving a customer price, accepting an order, recording a shipment and settling wires happen on the desktop office pages, next to the QuickBooks evidence. The phone apps show every one of those results and never invent a number: the board, the materials plan, the bench steps and the sizing are computed by the platform, not by the phone.

2. Put them on your home screen

Each app is a web app: nothing to download from a store, and every update reaches the phone the next time it is opened. The plant and office apps work in the workspace of your work email (**cleancell.us**). The customer app works for any email the customer verifies. Open the address once from the link the office sends; the app remembers the workspace after that.

Omega Logic on your phone

Three apps: the plant, the office, the customer. Install them, run the work, one system. ClearSky-OMEGA

iPhone or iPad (Safari)

1. Open **Safari** and go to the app's address (table above).
2. Sign in with your work Google account. A customer taps **Email my login link**, opens the email and taps the link, or uses Google.
3. Tap the **Share** button (the square with the arrow, at the bottom of the screen).
4. Scroll the sheet and tap **Add to Home Screen**, then **Add**.
5. Open the app from the home screen from now on. It opens full screen, with your company's icon and name.

Android (Chrome)

1. Open **Chrome** and go to the app's address.
2. Sign in with your work Google account, or, for a customer, the email link.
3. Tap the Chrome menu (three dots) and choose **Install app** or **Add to Home screen**.
4. Confirm. The app appears with your other apps, with its own icon. Each of the three installs separately.

Access. Plant and office: your work email must be a member of the company's workspace; if sign-in says the workspace is not ready, or the app says "Open the app once from your office link", open the address with ?org=cleance11.us once, or contact ClearSky. Customer: the first sign-in creates the account from the verified email; a company account is set up by the office so several people share one account, one set of terms and one PO queue.

3. The Plant app

Five tabs along the bottom, for the people building the units.

- **Today:** open work orders, late, with holds, mine; today's scans, units that reached Ready, refusals, test fails; **needs a person** (held, stuck, failed, quiet benches, tap to open); my work or what is up next; **Scan at a bench**.
- **Work:** every open work order, late first, then urgent, then by target date, with All / Mine / Late / Holds / Ready filters. Tap one: stage, target, built %, ready units, holds, next operation, what it is **short of**, every unit with its station and step progress.
- **Scan:** opens the bench screen. Paired once as a **roaming phone**, the builder picks the bench they are at on each scan. Look up any serial from here.
- **Stock:** finished units by product (available, assigned, building) and the parts short for the open work, with the purchase list value.
- **Quality:** units on hold. Open one to place a hold with the reason, or release it with the disposition. A hold stops every scan on that unit until it is released.

The bench: this unit's steps and parts, issued on scan

Omega Logic on your phone

Three apps: the plant, the office, the customer. Install them, run the work, one system. ClearSky-OMEGA

The bench

Scan the unit's serial or its label. The screen shows the steps for this bench with each part and quantity for this unit. Scan a part's label, or tap **Issue**, to take it off stock and onto the unit; a lot number travels with it. A check step gets **Done**. When every step is complete the bench says which bench is next; the next bench refuses the unit while anything here is open. Scans queue when the yard has no signal and send when it returns.

4. The Office app

Five tabs, for the project manager, procurement and commissioning.

- **Today:** orders to price, awaiting deposit, in build, ready and shipped; **needs a person:** company POs to review, orders with an open customer request, orders that need attention, orders to price (tap to open); money (invoiced, received, outstanding, deposits awaiting, purchase list value); the plant (open, late, holds, ready).
- **Orders:** every order with its customer, lines, total and balance, and the work order's built % once it is on the floor. Filters: All / Needs attention / To price / Awaiting deposit / In build / Ready · shipped / Customer requests. Open one: lines, invoices, build, shipment, and the customer's requests. **Answer & close** a request here; the customer reads the answer on their order. **Verify ready · invoice the balance** is on an order in production.
- **POs:** PO loads. Choose the company (or add one), the billing contact, paste the lines, one line per product per PO: PO number, SKU, qty, ship-to name, address, city, state, ZIP, requested date, notes. Lines with one PO number are one PO to one place. Each becomes an order awaiting pricing; nothing is accepted or charged; a PO number that already exists is named and skipped. Beneath: the company's uploaded POs under review and its orders.
- **Customers:** every account with its terms and logins. Open one: invoiced, received, balance, open requests, the terms to edit (deposit %, due days, future prices only), every order with its money, and the portal link to send them.
- **Stock:** finished units by product with **assign to an order** on each available serial (the plant then builds one fewer for that order), the parts short, and the supplier purchase orders still open.

5. The Customer app

Four tabs, for the buyer. **Design** opens first, because Site Map · Editor Lite is the product a customer subscribes to.

- **Design:** Editor Lite's status (trial to a date, active, or the price and what it includes, with the account rep to ask); **new site plan** from a site address; **quick size:** a kW and a duration against the supplier's design catalog, sized on the platform, with **Lay it out** (opens Editor Lite in the browser) and **Send as a PO** (lands on the PO sheet with the line filled in); every site plan with a tap to open it; the supplier's bill-based sizer.
- **Orders:** each order with its six-step milestone (received, confirmed, building, testing, ready, shipped), lines with the warranty date, order total and invoices with the pay link, destinations and loads, documents, the requests and answers, and **Request a change or ask a question:** a delivery address or date, a question, a change, a warranty claim.
- **POs:** PO loads for the customer, same sheet as the office, **Send these purchase orders.** Each is received for pricing; nothing is charged; fifty a day. Beneath: uploaded POs under review and the orders their POs became, with loads. Links for one PO to several sites and for uploading a PO document.
- **Account:** account number, company, rep, orders; the terms the supplier set; their own details to edit; agreements; how to install the app; the desktop portal.

How it reaches the office

A PO sent from the customer app is the same order the office keys in itself: it appears under Today as an order to price, on the desktop Company POs page, and in the customer's own PO list. A request sent on an order appears on that order for the office to answer. The milestone the customer sees is derived from the plant's scans, so nobody types a status.

Orders: the milestone track, invoices, a place to ask

ClearSky Energy Solutions · silmarillion.clearskyomega.com · page 4

Omega Logic on your phone

Three apps: the plant, the office, the customer. Install them, run the work, one system. ClearSky-OMEGA

6. One order across the three apps

1. The customer sends a stack of POs from the Customer app (or the office keys them in from an email in the Office app). Each is an order awaiting pricing.
2. The office approves the price and accepts on the desktop. The deposit invoice is queued in QuickBooks; when it is paid the order is released and a work order exists.
3. The builders see it on the Plant app's Today and Work tabs, register serials on the desktop, and build it bench by bench with the scanner, issuing parts as they go. The materials plan nets what was issued; the office's Stock tab shows what is short.
4. A finished unit built for stock can be assigned to the order from the Office app's Stock tab; the plant builds one fewer.
5. The customer watches the milestone move on their order and asks a question or changes the delivery address; the office answers from the phone.
6. The office verifies ready and invoices the balance, records the shipment on the desktop; the customer sees Shipped, the carrier and tracking, and the warranty date on each unit.

7. Try them first: the sandboxes

The same four screens with a sample company on the phone instead of the platform. Sign in with any email (the customer app: **ops@riverside.example** has the history). Answer a request, assign a unit, key in a stack of POs, issue parts at the bench, size a system. **Reset** in the purple strip starts the sample over. The numbers are the platform's own arithmetic; the data is not real.

SANDBOX	ADDRESS
Plant	silmarillion.clearskyomega.com/app-sandbox/plant
Office	silmarillion.clearskyomega.com/app-sandbox/office
Customer	silmarillion.clearskyomega.com/app-sandbox/customer
Bench	silmarillion.clearskyomega.com/app-sandbox/bench

8. If something looks wrong

- **"Open the app once from your office link so it knows your workspace"**: open the address with `?org=cleancell.us` once; the app remembers it.
- **Nothing loads after sign-in** on the plant or office app: your email is not a member of the workspace yet. Contact ClearSky or your administrator.
- **"Open your customer account first"** in the customer app: tap Account once; the record is created from your verified email. A company login is assigned by the office.
- **The bench says it is not paired**: a plant administrator creates a Roaming phone credential under Work orders on the desktop; paste the token once on the bench screen.
- **The app looks stale**: close it fully and open it again. Updates arrive on the next open. Data is never shown from a cache.
- **Offline**: the app says so and shows nothing rather than yesterday's list. The bench keeps its scans and sends them when the signal returns.
- **Editor Lite on a phone**: it opens in the browser at desktop width; it is a drawing tool and lays out best on a tablet or a desktop.

Questions: ClearSky Energy Solutions. The desktop office at silmarillion.clearskyomega.com/omega-logic?org=cleancell.us has the same data with every control, and the full manual is in the workspace documentation.
