OMEGA PRIME

Omega Prime → Omega Teleios

One site, start to finish: the grid, the circuit, the design, a proposal in your name, the order it becomes, and the job delivered complete.

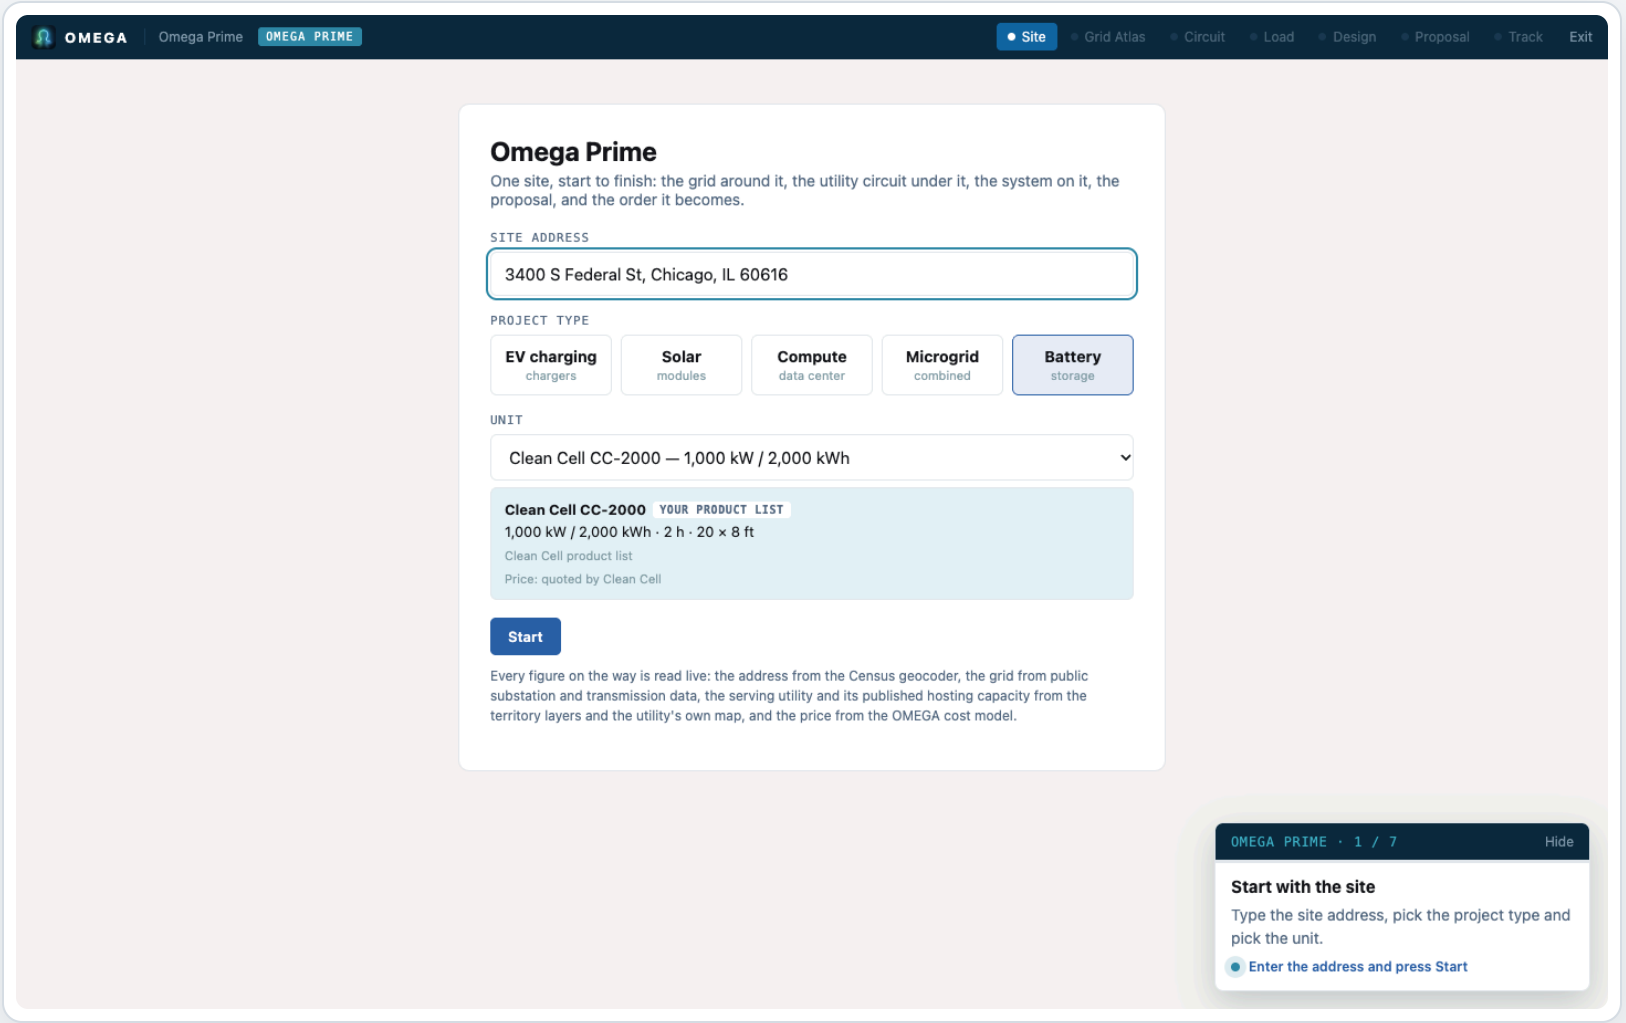

Site → Grid Atlas → Circuit → Load → Design → Proposal → Track → Teleios

ClearSky Energy Solutions · October 2026

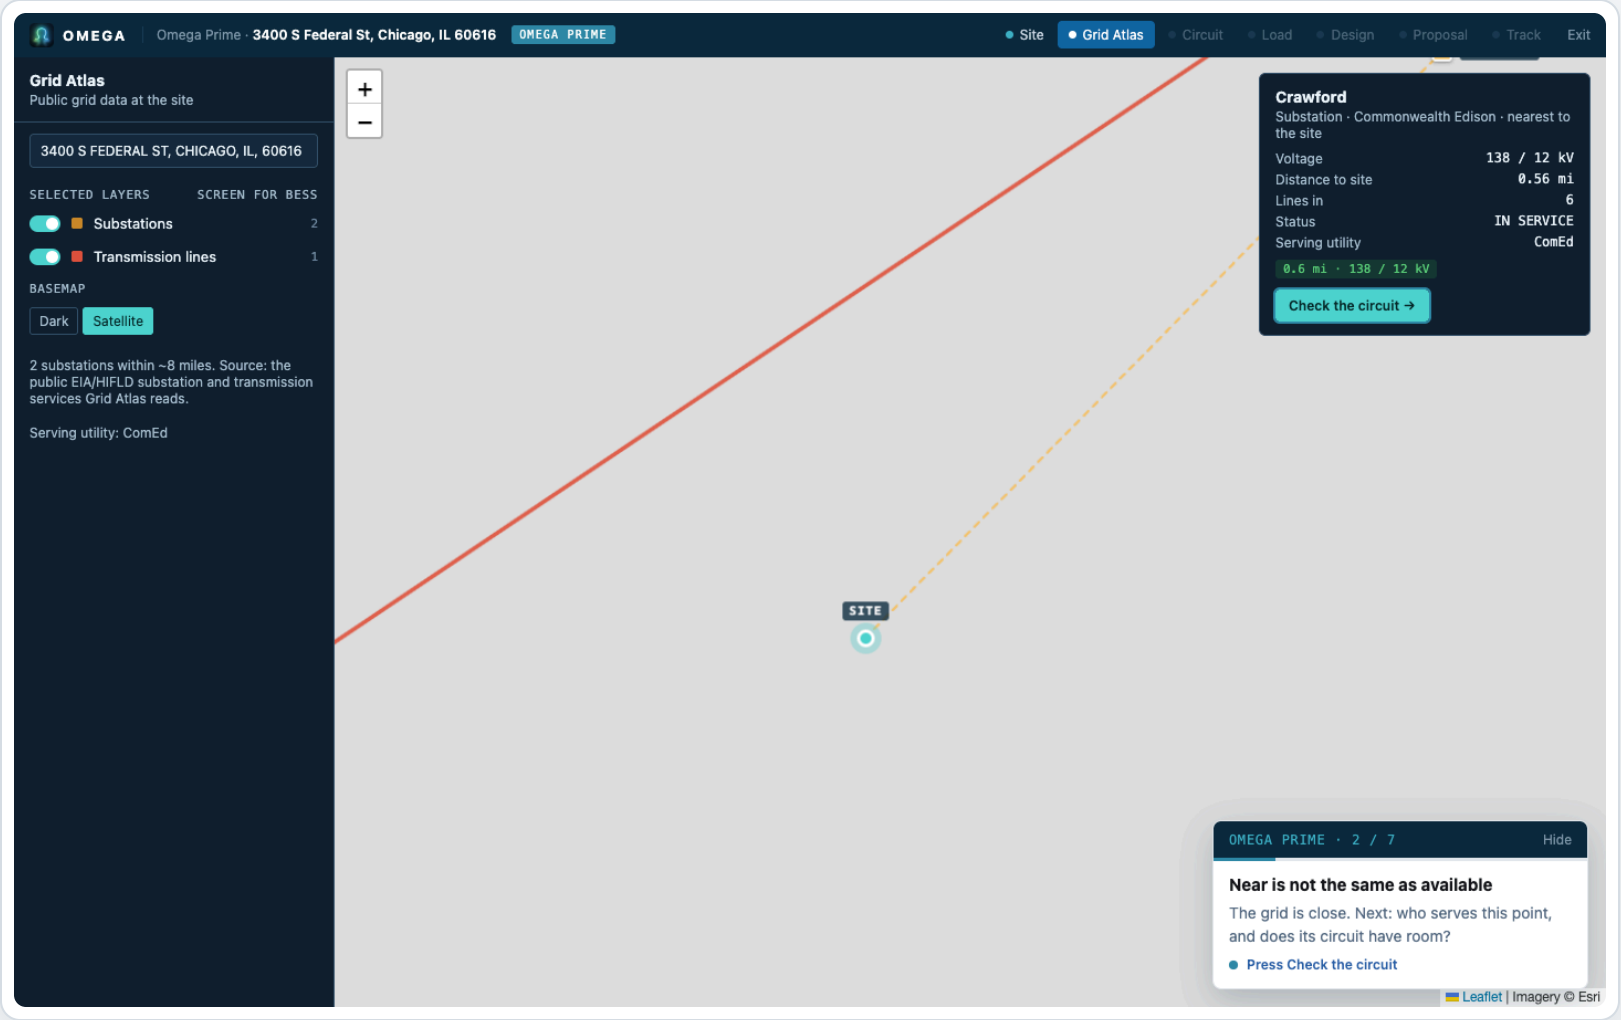

Start with the site

- Type the address, pick the project type and the unit.
- Your own products first, then Clean Cell’s units. Specs only, never a price.
- The site is saved from this moment and reopens from **Continue a site**.

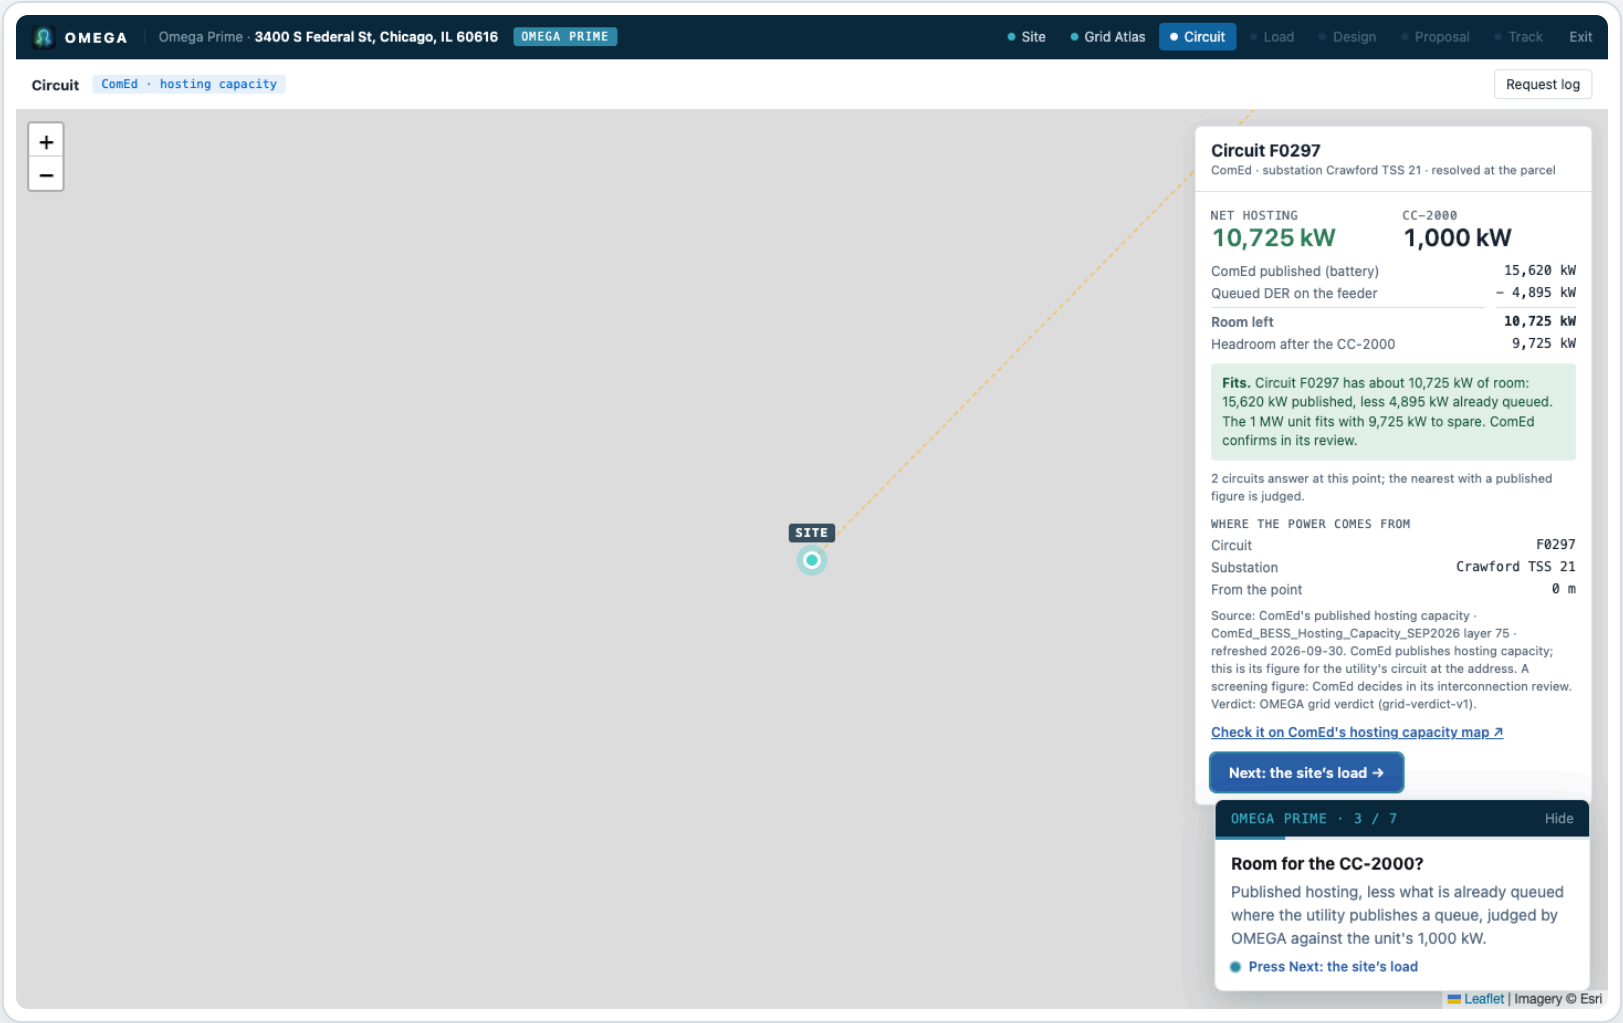

The grid around it

- Public substation and transmission data around the point.
- The nearest substation is opened; satellite shows the yard, the roads and access.

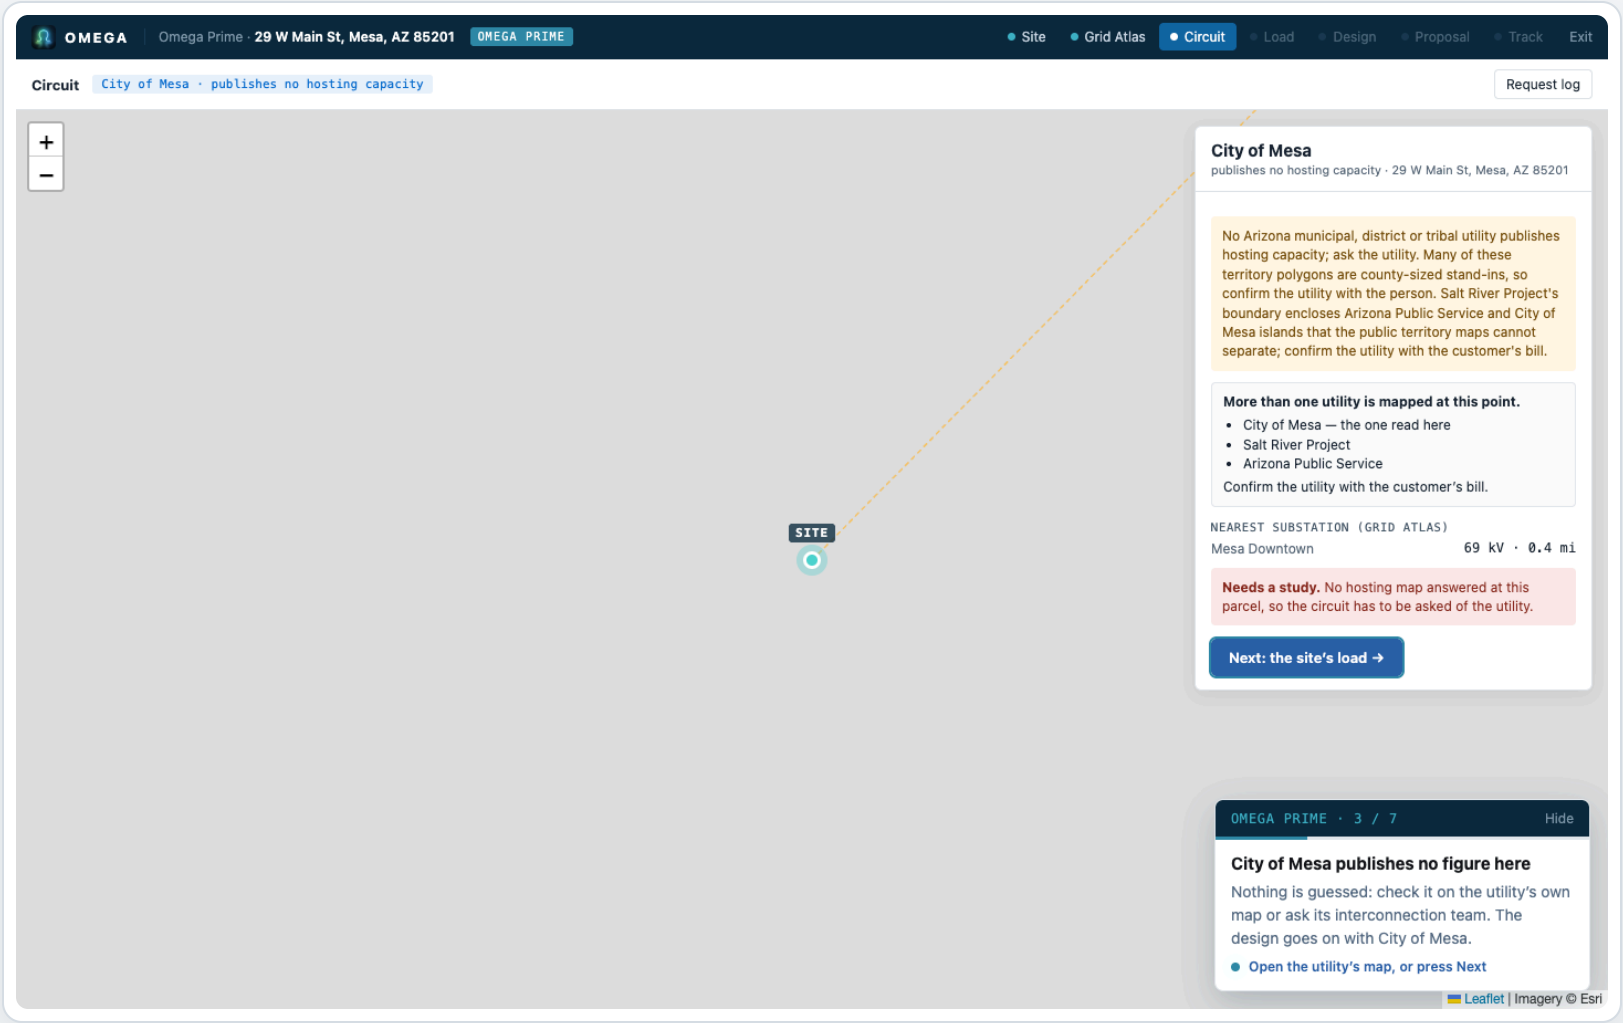

The circuit under it

- The serving utility is named from the territory layers.
- Its own published hosting capacity, less what is queued, is judged against the unit by the OMEGA grid verdict.
- Every answer links the utility’s own map to verify.

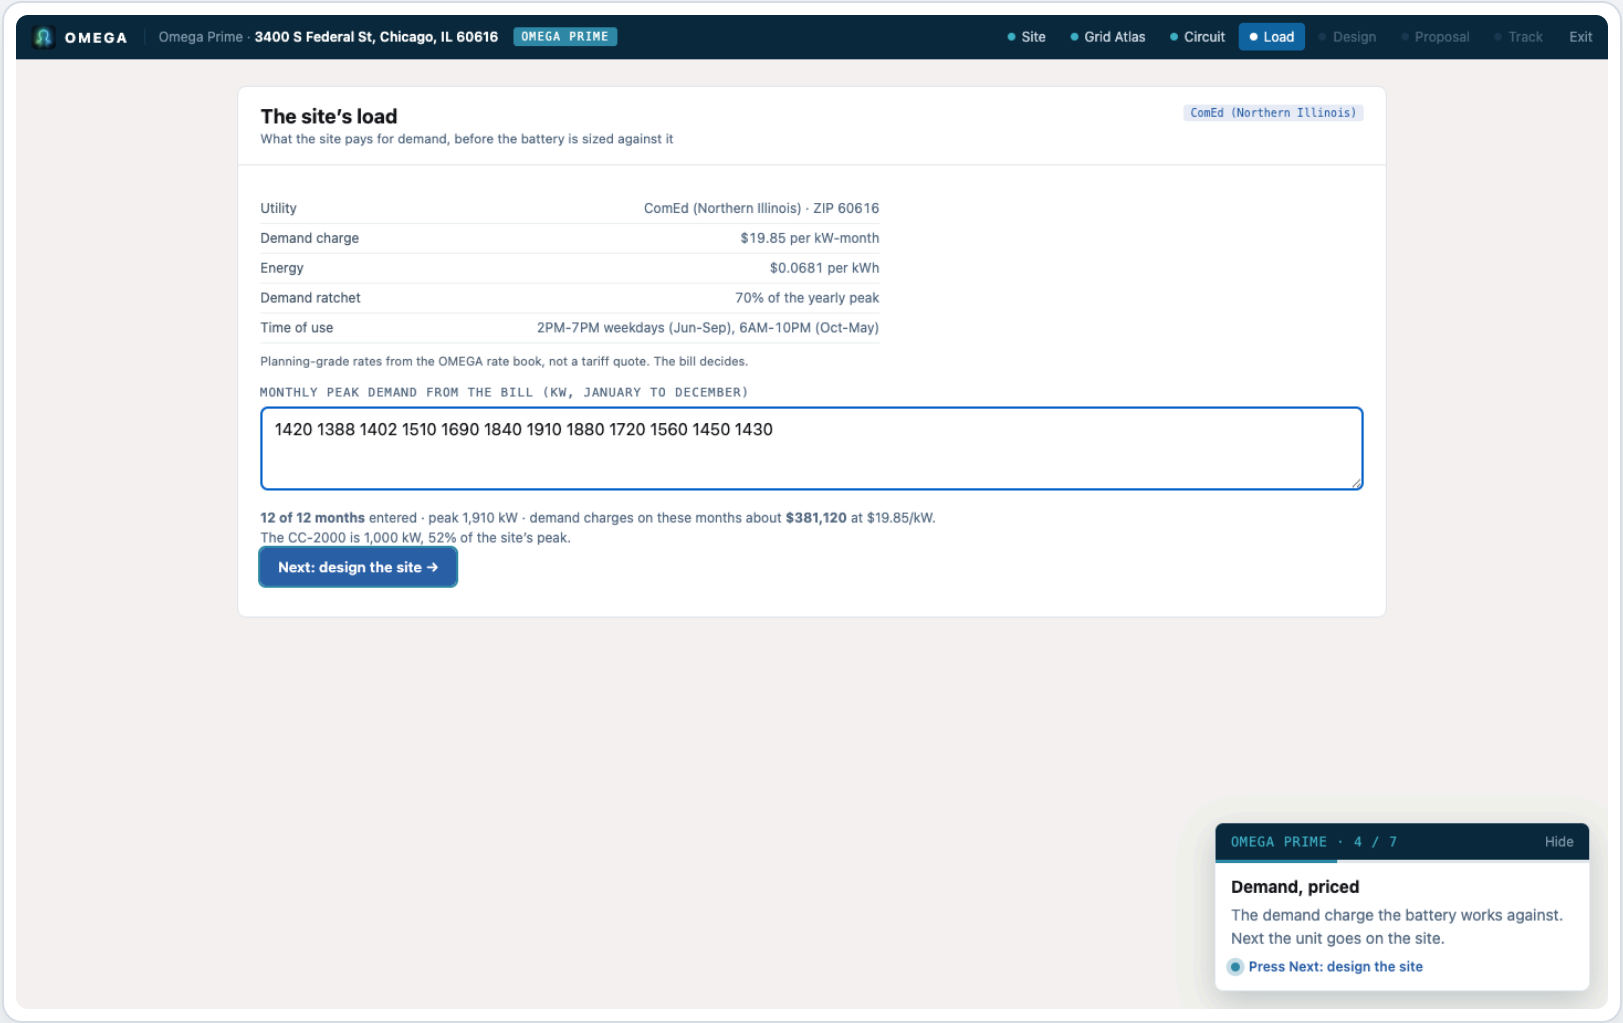

Every utility, in nine states

- IL, FL, GA, NJ, AZ, CA, CT, MA and RI: 15 verified utility sources.
- Mesa, AZ: the City of Mesa leads, with SRP and APS named beside it. Nothing is guessed: no figure published means none shown.

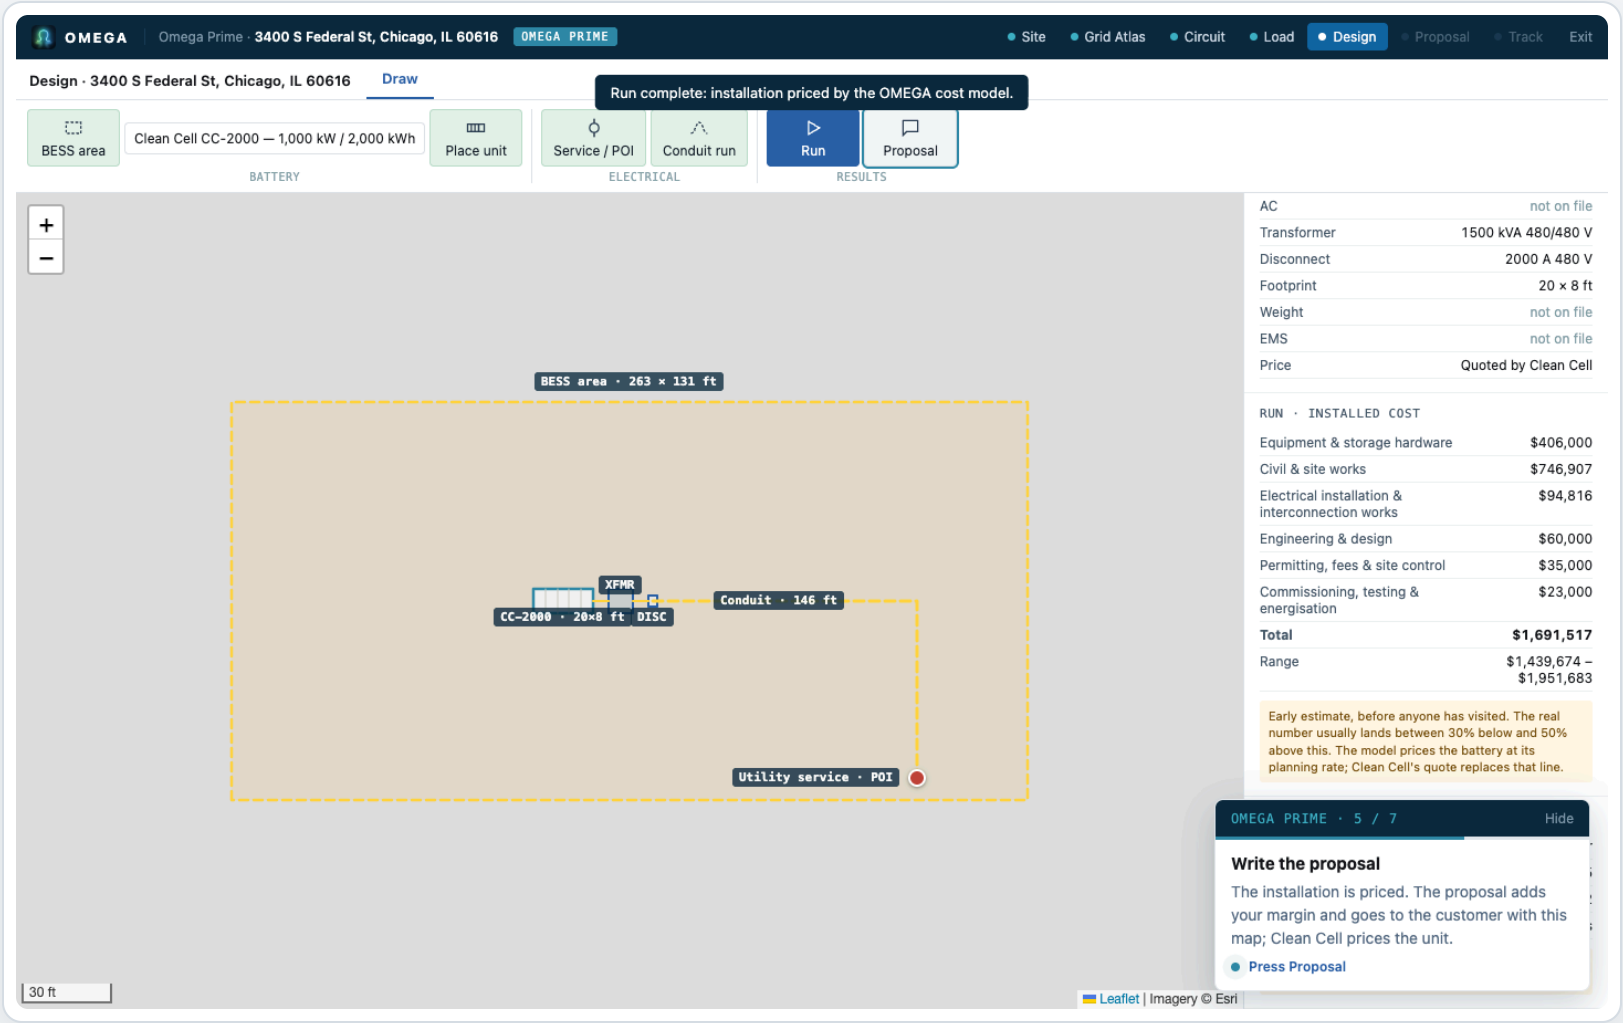

What the site pays for demand

- The serving utility’s planning rates, found by its EIA id.
- The bill’s twelve monthly peaks, typed or pasted, price the demand charges.

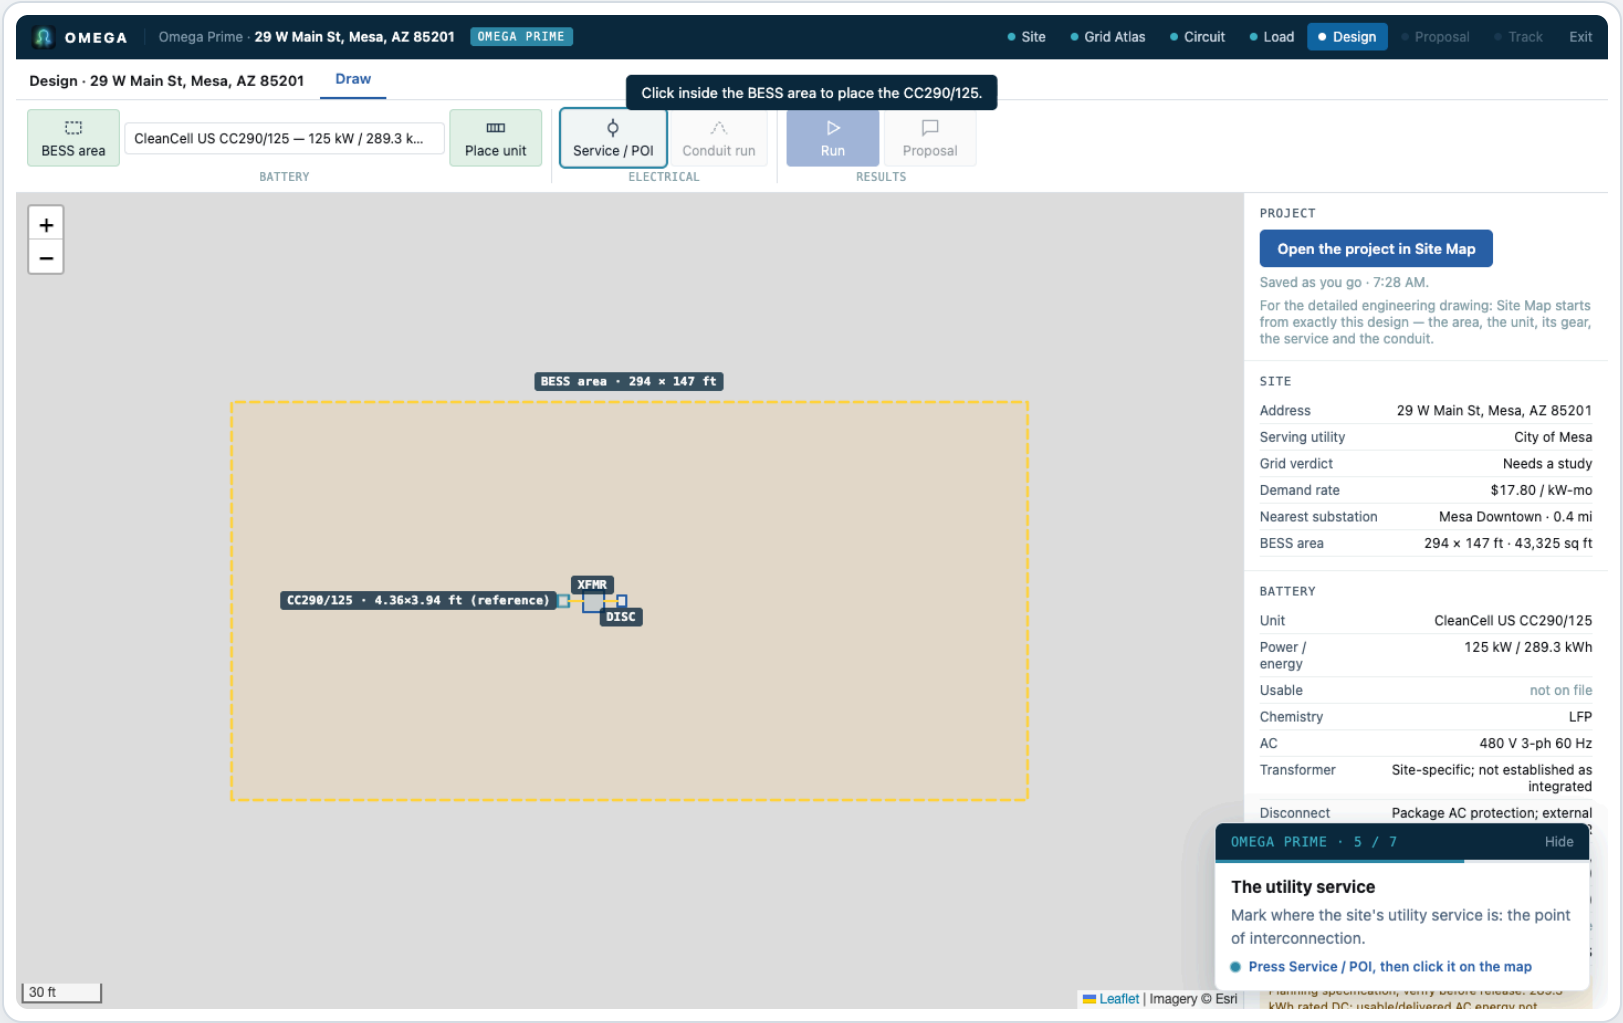

Design it on the satellite map

- Mark the area, place the unit at its footprint with its transformer and disconnect, mark the service, run the conduit.
- **Run** prices the installation on the OMEGA cost model, on the server.
- This design is what the proposal is priced from. Site Map is where the detailed engineering drawing is made from it.

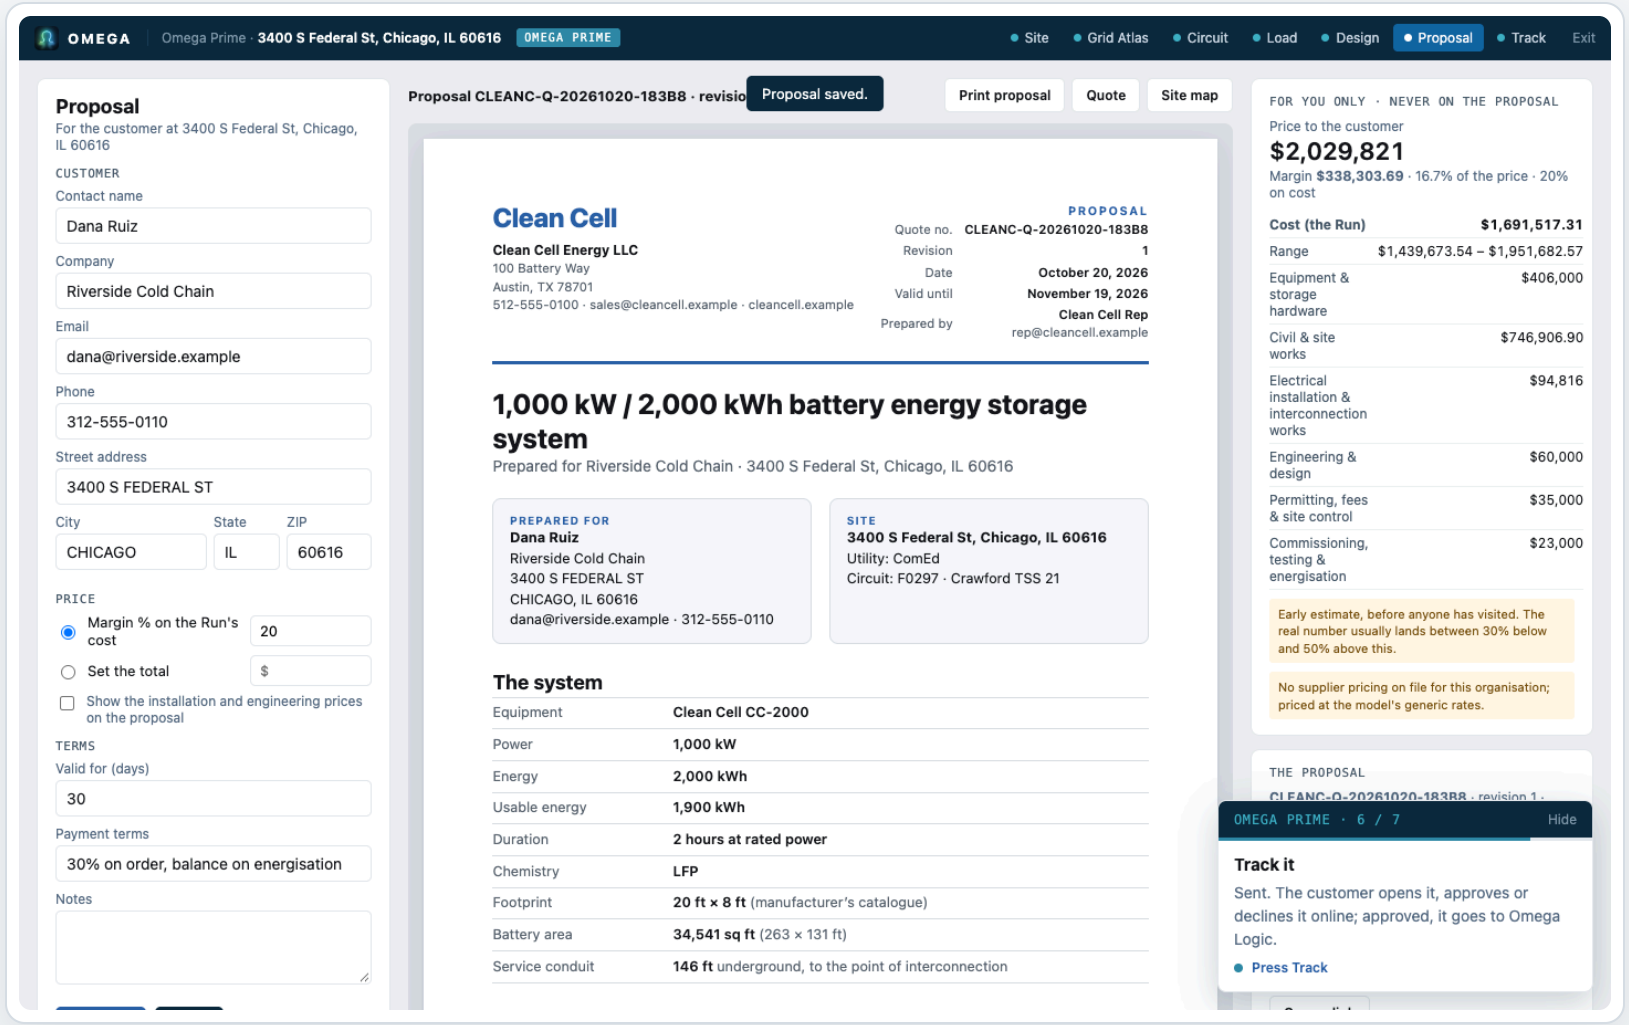

Clean Cell units placed as real blocks

- A unit whose maker has not released its footprint is drawn at its reference size: the CC290/125's cabinet, or a 20 × 8 ft container for the LG JP-2 and the Smart Module.
- Labelled "confirm on the submittal"; the size from the submittal replaces it.

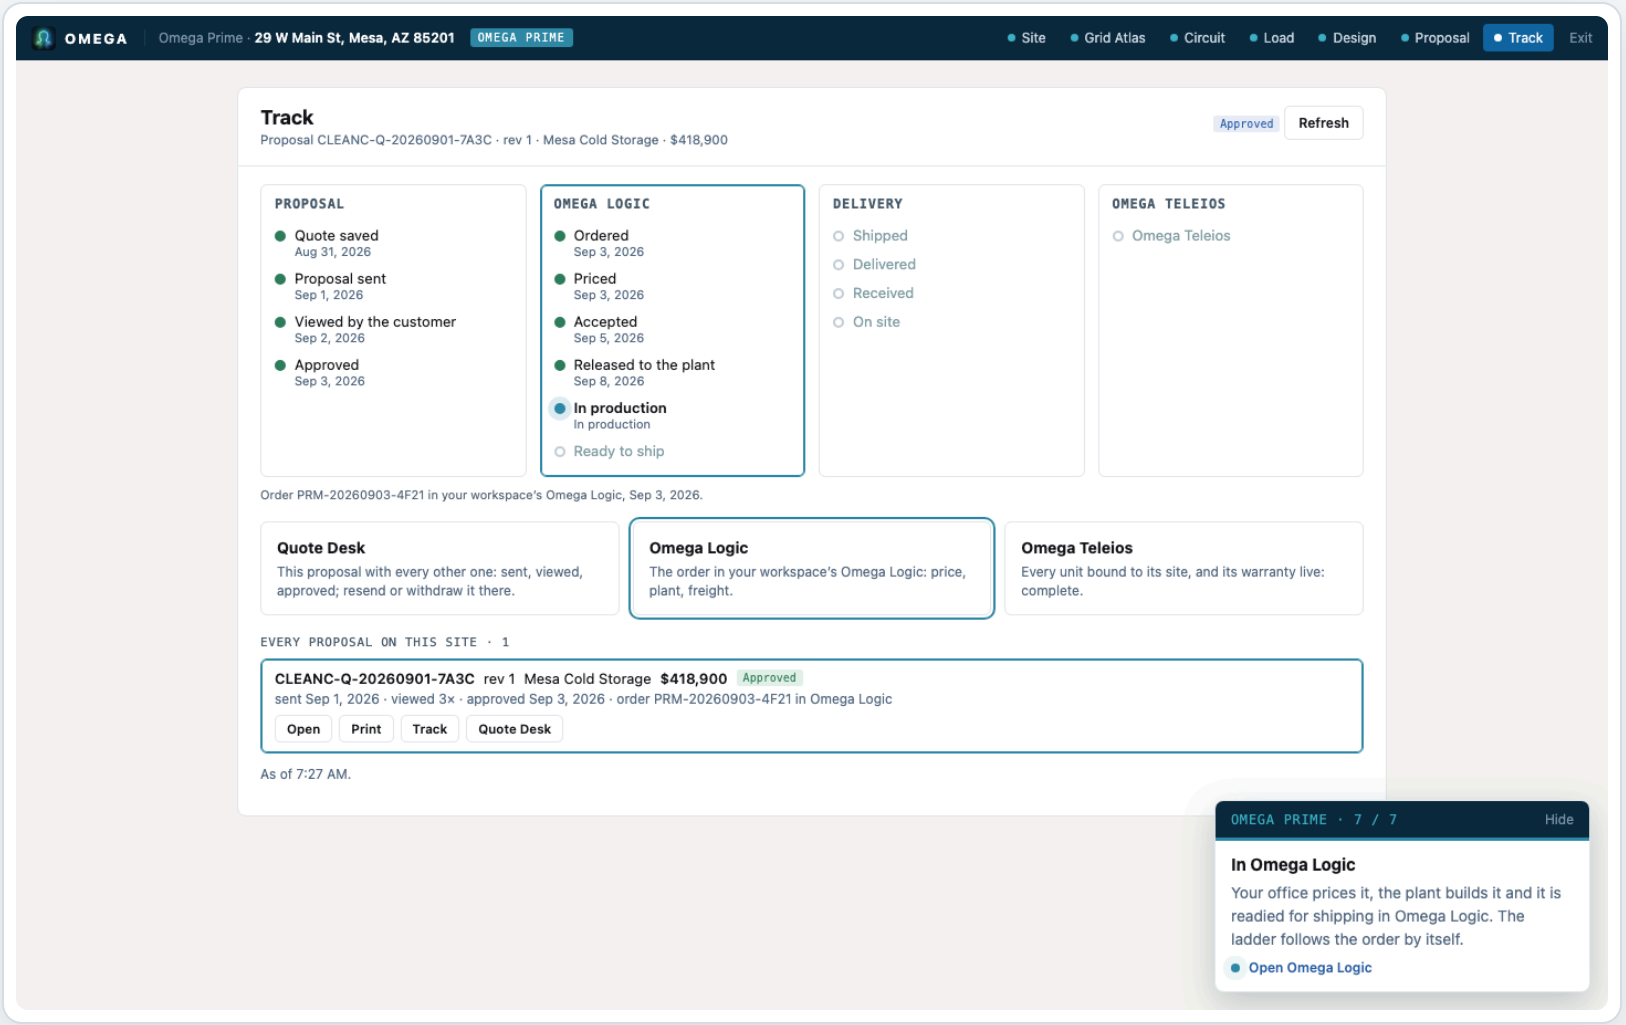

A proposal in your own name

- The customer, your margin (or a set total) and the terms.
- Priced on the server from the design; your company's letterhead; cost and margin stay on your side only.
- Print the proposal, the quote or the site map, email it, or copy a link.

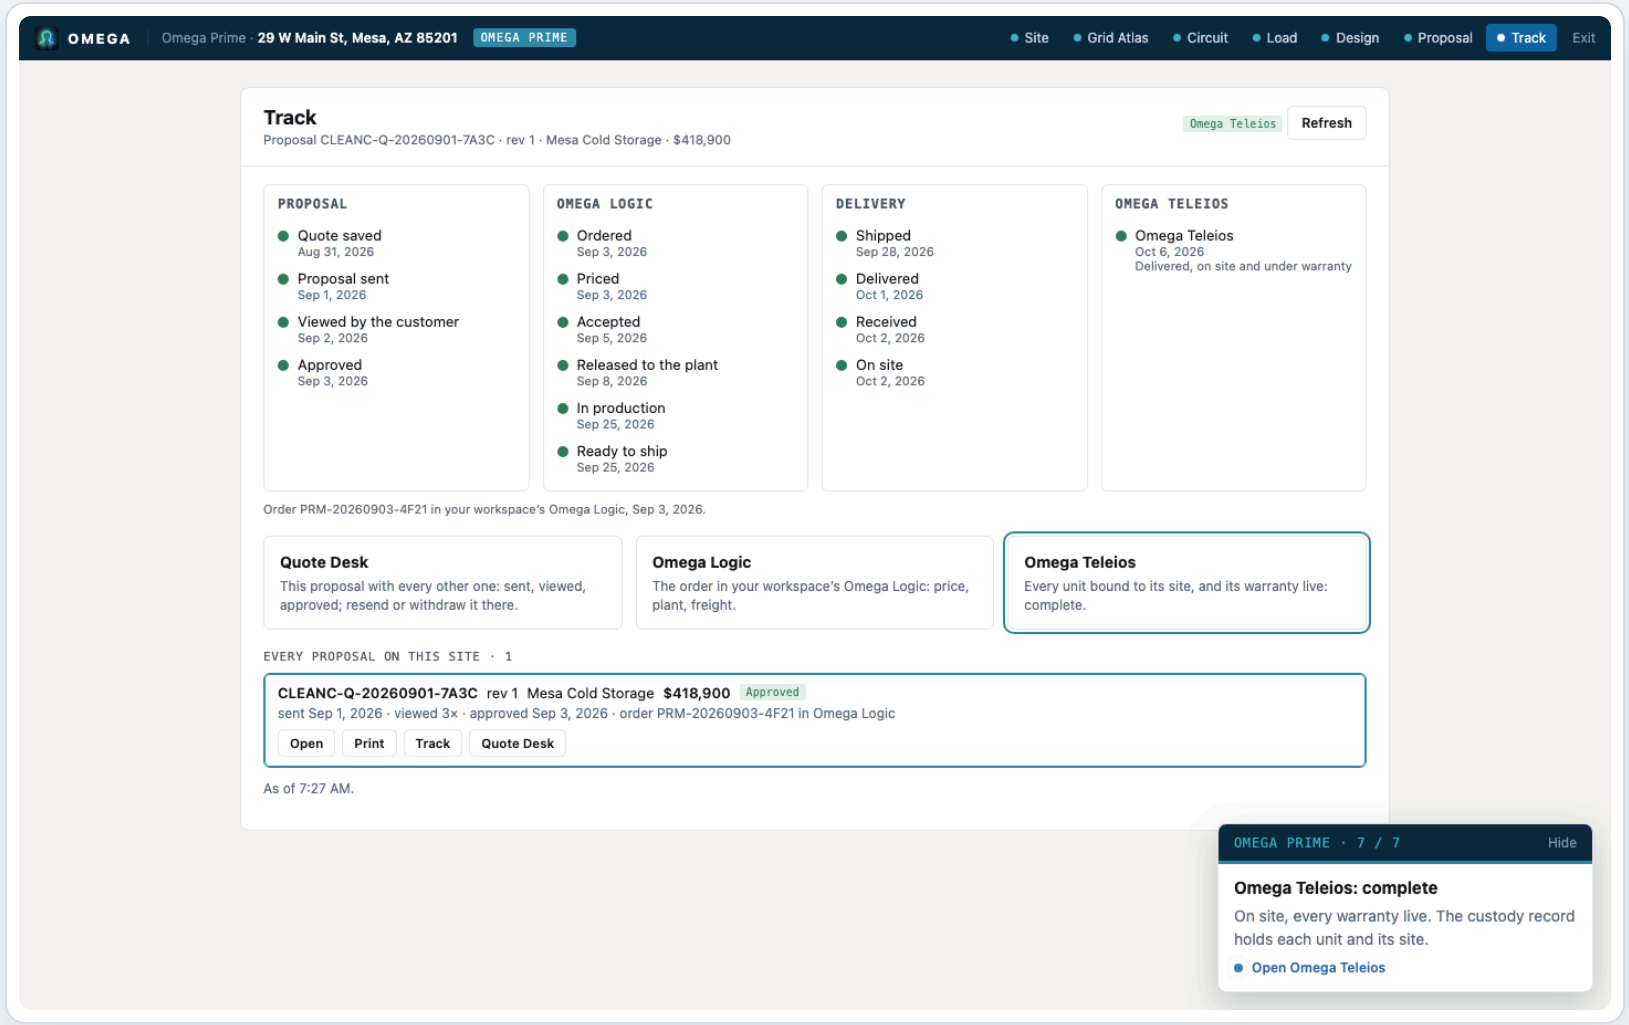

Track it, from sent to built

- Sent, opened, approved online by the customer.
- Approved, it becomes an order in your own Omega Logic: priced, accepted, built, readied to ship.
- The ladder follows the order by itself.

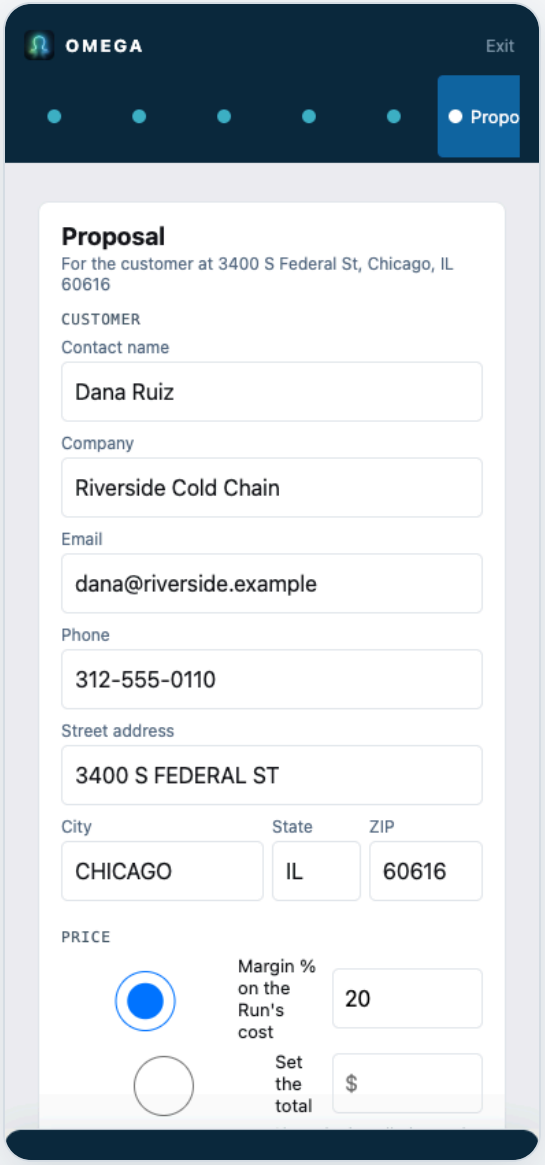

Omega Teleios: complete

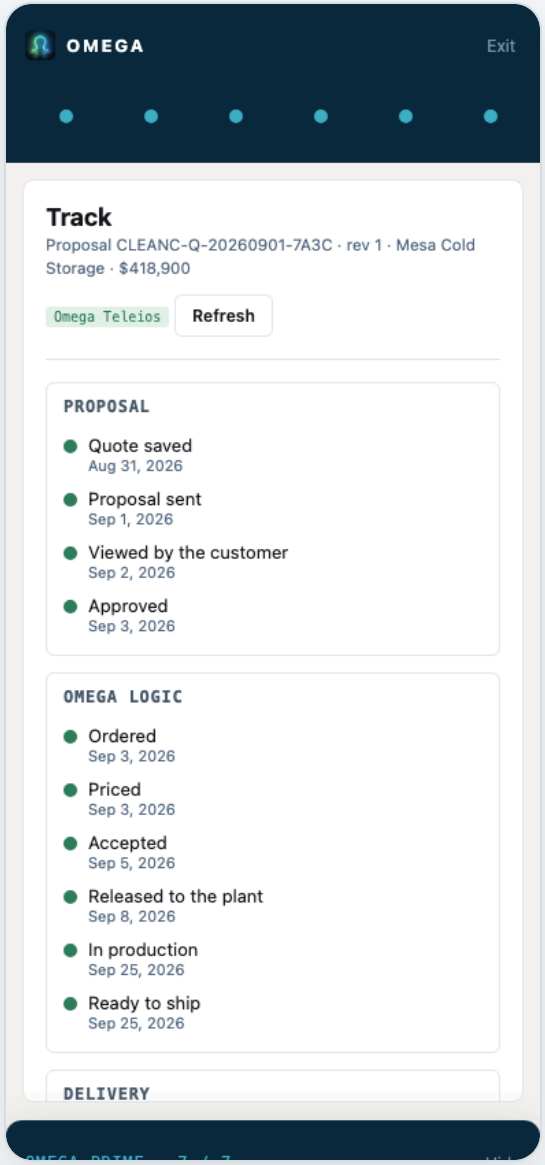

- Shipped, delivered, received and bound to the site.
- **Teleios** means complete: every unit on site, and its warranty live. Dated the day the warranty started.
- The Omega Teleios card opens Sites & custody: each unit, its site, its warranty.

On a phone, the same path

- Every step fits a phone: the proposal and Track included.
- Install it from the browser as an app.
- The guide panel docks under the screen; on a computer it can be dragged anywhere.

Where everything lives

Your sites	**Omega Prime** → Continue a site (delete a site from there too); the **Projects** page, with an Omega Prime chip, the proposal's status and the order on each row.
Proposals	The Proposal and Track steps of each site, and every proposal in the **Quote Desk** → Customer quotes: sent, viewed, approved.
Orders	Approved proposals become orders in your workspace's **Omega Logic**.
Delivered	**Sites & custody**: each unit bound to its site, its warranty live. That is Omega Teleios.
Engineering	**Site Map** opens any Prime design for the detailed engineering drawing.
